

We remove uncertainties around intrusions

The Visual Verifier forms the core of our overall solution and offers capabilities for the detection and verification of validity of intrusions and physical attacks, in areas where high-value losses can potentially occur in the organisation. Our modular wired intrusion detection system with ground – breaking versatile image capturing and unequalled data communication capabilities make our solutions unique in the market.

Why watch an entire movie, if one frame tells the story?

Monitor and manage events in real-time.

Real-time encrypted transmission of alarm triggers and snapshots over secure network.

High quality colour snapshots regardless of light.

Highly effective as control room operators deal with exceptions only.

Designed to cater for African conditions - low bandwidth & power volatility.

Cost-effective and rental options for approved clients.

Instant remote visibility of site without latency.

AI COLLECTION AND RECOGNITION

Facial Collection and Recognition. - Correctly identifies gender and emotions, and estimated age. - Leveraging our unique facial recognition algorithm, SecuVue dramatically shortens the time-to-market for complex security and surveillance solutions.

Watch List Management. Easy-to-configure watchlist management with automated notifications of when a "person-of-interest" is identified by the SecuVue platform.

People Counting. - As soon as a person has passed a virtually definable region or line, it will automatically be counted. - The counting is performed directional (Two directions per line). - Counting lines can be formed and oriented individually thus enabling not only the counting in passages but also for regions.

Notification Management. Convenient automated alerts with a high performance messaging library to ensure that the right people are informed at the right time

Intrusion Detection. As soon as an object moves into a defined area, an event is generated, which can be processed according to situational demands and business rules defined by the user.

Activity Heatmaps. Actions remain recognisable. - Unnecessary intrusion into personal privacy is prevented without compromising security.

Multiple IP Camera Channels. SecuVue can handle and manage several camera streams per server without compromising speed or accuracy. - It is designed to manage exceptions but also caters for continuous streaming for realtime surveillance.

Privacy. To make optimal use of available sales or exhibition areas, frequently used paths or areas as well as the popularity of certain products can be made visible, through real-time visualisation and automatically generated statistics.

License Plate Recognition. - LPR is a technology that uses optical character recognition on images to read vehicle registration plates. - ideal for vehicle access and traffic control. - identifies each vehicle's license plate, make, model, body type and colour.

Scene Analysis: Depending on the scenario, the Scene Analyzer can for instance detect if an object was in a particular frame.
